Combine and Improve Internet Connections on Linux and Raspberry Pi with Speedify

PHILADELPHIA, August 8, 2019 – Connectify, Inc. is excited to announce version 8 of Speedify, the company's flagship bonding VPN service. Unlike other VPNs, Speedify combines two or more Internet connections at once on your computer and mobile device. It's the perfect tool for live streamers, online gamers, reporters, travelers, and anybody who needs a reliable, fast, and secure Internet connection.

Speedify 8 brings support for Linux, including a wide variety of devices, from computers to the hot new Raspberry Pi 4 Model B. Previously available only for internal testing purposes and limited beta testing, Speedify for Linux now fully supports any Debian based operating system, including Ubuntu, Linux Mint, and Raspbian Linux. Speedify for Linux also includes scripts to easily share a bonded VPN connection from your Linux machine to your other devices. You get stable, fast and secure Internet anywhere - at home, while traveling, or on the go.

"We listened to our users' feedback and created the perfect tool for bonding Internet connections on Linux machines. Everyone using the Internet for streaming, gaming, or trading on the go can now add weightless bonding router capabilities on Raspberry Pi or other Linux based machines in their backpack," says Alex Gizis, CEO. "There's no need to buy expensive multi-thousand dollars bonding hardware now, when you can get Speedify at only a fraction of the cost."

And that's not all, Speedify 8 is also accompanied by a brand new Python API available on GitHub. This lets Windows, macOS, and Linux users interact and control Speedify from their programs and scripts. "Our ultimate goal is to enable everyone to benefit from our channel bonding technology - no matter what platform or operating system they're on." noted Gizis.

Speedify is available for download on Windows, macOS, iOS, Android, and Linux from the Speedify website (https://speedify.com) or directly in the App and Google Play stores.

<u>About Connectify</u>

Connectify creates apps that allow people to do more with their Internet connections. Their products include Connectify Hotspot, the first software-only virtual router for Windows; Pingify, a mobile network diagnostics tool app for iOS and Android to test the reliability of Wi-Fi, cellular and VPN connections; and EdgeWise Connect, a native iOS app which rescues users from the edge of Wi-Fi. From their offices in sunny Philadelphia, they continue to innovate by developing and designing apps that have one thing in common: they make your Internet better.
